

Niagara Information and Conformance Statement (NICS)

OVERVIEW

Lynxspring's Niagara offerings include a licensing model that provides OEMs with the ability to define the various levels and types of Niagara interoperability their products will support. The feature is referred to as the Niagara Information and Conformance Statement or NICS. There are two primary interactions that the NICS addresses – the sharing of data between stations (JENES/JACEs and Supervisors) and the ability for a tool (i.e., JENESys ProBuilder/Workbench) to engineer a station.

NOTE: This NICS statement applies to both Lynxspring's JENESys and JENESys Edge portfolios.

The roots of the NICS concept grew from gathering and understanding the requirements of the various users of Niagara technology consisting of end users (i.e. building owners), partners (i.e. BAS OEMs) and Lynxspring. Here's an overview of those requirements:

End User Requirements Include:

- The ability to control their system and determine which contractors can bid or engineer their system
- The ability to insure they can prevent unauthorized parties from accessing the system for engineering or system changes
- The freedom to individually manage authorized parties independent of Lynxspring
- A methodology that is easy to understand and use

Partner Requirements Include:

- The ability to define the various levels and types of interoperability their products will support
- The ability to prevent unauthorized parties from accessing an installed system to make engineering changes in order to adequately manage warranty/contractual commitments
- The freedom to individually manage their own compatibility rules independent of Lynxspring
- A methodology that is easy to understand and use

Lynxspring's Requirements Include:

- To provide a highly flexible technology solution that will enable partners to achieve their individual business and product goals
- To provide the ability to individually manage software modules that support new features and options
- To create a methodology that is easy to understand and use

ELEMENTS OF THE NICS

The NICS provides a structure (or schema) that OEMs can use to define the various levels and types of Niagara interoperability their products will support. The NICS definitions are contained in the license file which is checked by a station, or tool, when it starts up.

There are 5 simple elements to the NICS: BrandID, Station Compatibility In, Station Compatibility Out, Tool Compatibility In, and Tool Compatibility Out. These elements can be combined in a variety of ways to achieve unlimited flexibility. Let's review the details and usage of each element:

BrandID

Every licensed station and tool has a Brand Identifier (BrandID). This field holds a text descriptor that the OEM chooses as the identifier for its product line. Each station or tool can have only one BrandID entry. Lynxspring's JENESys Edge products, as well as JENESys 8000 and JENESys 9000 have the following:

BrandID = Lynxspring

Station Compatibility In

This field is a list of brands that this local station will allow Niagara data to come in from. Simply stated from the point of view of a JENE/JACE, “this is the list of brands that can I can accept data from”. For example, Lynxspring’s products would contain:

Station Compatibility In = All

Note:
The compatibility fields can contain; a single brand “ABC”, a list of multiple brands “ABC, XYZ”, no brand “None” or all brands “All”.

Station Compatibility Out

This field is a list of brands that this local station will allow Niagara data to be shared with. Simply stated, “This is the list of brands that I can share data with”.

Tool Compatibility In

This field is a list of brands that this station will allow to be connected to it for engineering of its application. Simply stated, “This is the list of brands that can engineer me”.

Tool Compatibility Out

This field is a list of brands that this tool is allowed to connect to and engineer. Simply stated, “This is the list of brands that I can engineer”.

NICS EXAMPLES

This section shows samples of potential NICS that might be used by a manufacturer.

<i>Example 1:</i> No connectivity restrictions. There are no restrictions on which brand stations or tools can interact with the system. The station and tool NICS would be as follows:	Property	Value
	STATION COMPATIBILITY IN	All
	STATION COMPATIBILITY OUT	All
	TOOL COMPATIBILITY IN	All
	TOOL COMPATIBILITY OUT	All
<i>Example 2:</i> Restrictions on engineering tool access to a station. Station can interact with any brand but can only be engineered by tools from a particular brand (ABC in this example). The station and tool NICS will be as follows:	Property	Value
	STATION COMPATIBILITY IN	All
	STATION COMPATIBILITY OUT	All
	TOOL COMPATIBILITY IN	ABC
	TOOL COMPATIBILITY OUT	ABC
<i>Example 3:</i> Restricted system. Station can interact with only the specified brands and can only be engineered by tools from specified brands (ABC, XYZ, and DEF in this example). The station and tool NICS will be as follows:	Property	Value
	STATION COMPATIBILITY IN	ABC, XYZ, DEF
	STATION COMPATIBILITY OUT	ABC, XYZ, DEF
	TOOL COMPATIBILITY IN	ABC, XYZ, DEF
	TOOL COMPATIBILITY OUT	ABC, XYZ, DEF
<i>Example 4:</i> Fully restricted system. The station and tools are restricted to work only with the same brand (ABC in this example). The station and tool NICS will be as follows:	Property	Value
	STATION COMPATIBILITY IN	ABC
	STATION COMPATIBILITY OUT	ABC
	TOOL COMPATIBILITY IN	ABC
	TOOL COMPATIBILITY OUT	ABC

STATION VS. TOOL COMPATIBILITY

There are many facets to interoperability and open systems. Creating a distinction between data sharing and actual engineering of a database allows Niagara partners to achieve the optimal solution for their customers while protecting their interests. A good example is found in the increasing use of Niagara in equipment systems, a concept known as Niagara Appliance.

Having these two elements to define compatibility provides a manufacturer with the ability to enable their Niagara based products to work with other Niagara-based stations in a system, but protect their equipment system from activities that could damage it or adversely affect its operation. For example, an equipment manufacturer offering a Niagara Appliance would want that appliance to connect to any Niagara system that shares its data, but may not want anyone to be able to modify it with an engineering tool.

A TOOL FOR OWNERS

The NICS schema is an important tool for consultants, owners and operators of facilities. It enables them to specify the level of interoperability desired for their projects with a simple set of text descriptions. In this respect it can be considered similar to concepts such as BACnet™ PICS statements or BIB definitions or LONMark™ interoperability certification although it is far simpler to understand, interpret and utilize.

IT DOESN'T END WITH NICS – NIAGARA INCLUDES A COMPREHENSIVE SECURITY INFRASTRUCTURE

The NICS infrastructure provides high level, manufacturer defined, interoperability management, but it is only part of the security methodology for Niagara -based software applications and products. This is where the security infrastructure comes in.

Access to an installed system by a user or by another station is limited at the device level by security and passwords. Niagara's extensive security model provides fine grained control over access to an engineering tool, a station, and even down to individual displays and components. Please contact Lynxspring for detailed information on the security model.

The following is suggested language you may wish to use in writing specifications to ensure an open Niagara system:

NIAGARA INFORMATION AND CONFORMANCE STATEMENT (NICS)

The Niagara Information and Conformance Statement (NICS) for all Niagara Software shall allow open access and be set as follows: `accept.station.in="*" accept.station.out="*" accept.wb.out="*" accept.wb.in="*" .` In any case, the end user shall maintain the right to instruct the contractor to modify any software license, regardless of supplier, as desired by the end user. The contractor shall not install any "brand-specific" software, applications or utilities on Niagara Framework-based devices unless accessible by any brand of Niagara tools.

All hardware and field-level devices installed shall not be limited in their ability to communicate with a specific brand of Niagara Framework JENE/JACE. They shall also be constructed in a modular fashion to permit the next generation and support components to be installed, in replacement of or in parallel with existing components. All controllers must be able to be programmed within the Niagara Workbench/JENEsys ProBuilder.

At the completion of the project, the owner shall be given all existing platform and station login credentials to include; super user (admin) usernames; passwords and passphrases.
